

Your **SOLUTION** for fine material processing

Vertical Durability Cell

When found in sand, clay can render some material deposits difficult to finish. AZFAB has a Durability Cell that can add years of life to reserves previously thought to be untouchable. When clays are left in finished products, moisture is often retained. This moisture causes stockpiles to bleed. In addition, these remant clays will eventually dislodge themselves and lower the product's sand equivalent and durability index.

The AZFAB Vertical Durability Cell provides the scrubbing power necessary to liberate these clays. This unit is not only highly efficient, it is designed for a long trouble-free life. Every wear point is lined with 1/2 inch 40 durometer natural rubber. The AZFAB Vertical Durability Cell has optional features on agitator shafts. The shafts can be a single, solid shaft line or a 3 peice shaft line with interchangeable parts allowing for longer shaft life. The Vertical Durability Cell is the perfect solution for your sand problems.
